Tue May 27, 2014
----

objective:
[1] building embedded OS, and then run it in qemu

source:
[1] http://*pressreset.net/2013/09/buildroot-and-qemu-the-quickest-receipe-for-your-own-linux/*

steps:
[1] download git repo

        $ git clone git://*git.buildroot.net/buildroot*
        $ cd buildroot/

[2] setup the config file **for** arm cpu

        $ make qemu_arm_versatile_defconfig

[3] Where qemu_arm_versatile_defconfig is file & defconfig name from buildroot/configs directory.

        $ make menuconfig

And menu similar to Linux kernel menuconfig shows up. Since we preconfigured it with the defconfig file,
there is almost nothing to change here. Be sure to have all tools from Build options —> Commands menu
installed in your host system.
In Build options check Enable compiler cache which will save compiler output files and make consequent
compilations faster. It is not necessary though.

[4] build

        $ make

We have now the time to chat a bit. So, what we have just done is we run a massive process of downloading
core packages and compiling them into toolchain, kernel and root filesystem that will became our own,
small Linux OS. Ever heard that making Linux **for** embedded devices is hard? Well, it is. But we have taken
three huge shortcuts.
First, by using Buildroot which is a big set of Makefiles that configures and compiles GCC, C library and
whole OS ecosystem (BusyBox). What it produces in the end are the Linux kernel and the image of root
filesystem.
Second shortcut is configuring Buildroot with qemu_arm_versatile_defconfig. There is nothing to change
within the kernel thanks to this. This configuration file along with buildroot/board/qemu/arm-versatile/
linux-3.10.config tells Buildroot to set kernel configuration to suit ARM Versatile boards template. This
is one of the development platforms supported both by Linux and QEMU out of the box.

[5] run qemu
The last one is the use of QEMU. Because of that, we **do** not have to configure any bootloader (like U-Boot
for instance). All we need to **do** is to run one command right after the compilation ends:

```
$ qemu-system-arm -M versatilepb -kernel output/images/zImage -drive file=output/images/
rootfs.ext2,if=scsi -append "root=/dev/sda console=ttyAMA0,115200" -serial stdio -net nic,model=smc91c111
-net user
```

analysis:
// *assumptions*
        1. used " $make qemu_arm_versatile_defconfig "
        2. didn't change anything in (or run the following command) " $ make menuconfig"

[1] login: there is no password, though there is a username which is "root"

```
        Welcome to Buildroot
        buildroot login: root
        #
```

[2] running "uname -a" and "df -h /"

```
        # uname -a
        Linux buildroot 3.13.5 #1 Tue May 27 14:39:10 EDT 2014 armv5tejl GNU/Linux
        # cd /
        # df -h
        Filesystem                Size      Used Available Use% Mounted on
        /dev/root                 3.0M      2.0M    842.0K  71% /
        # pwd
        /
        #
```

[3] analysis all commands in the system

```
        $  echo ${PATH//[:]/ ' '} | xargs ls -lsh
//or
        $ echo $PATH | tr ':' ' ' | xargs ls -lsh

        # echo ${PATH//[:]/ ' '} | xargs ls -lsh
        ls: /usr/bin/X11: No such file or directory
        ls: /usr/local/bin: No such file or directory
        /bin:

[6] busybox version

```
        # busybox
        BusyBox v1.22.1 (2014-05-27 14:35:53 EDT) multi-call binary.
        BusyBox is copyrighted by many authors between 1998-2012.
        Licensed under GPLv2. See source distribution for detailed
        copyright notices.

        Usage: busybox [function [arguments]...]
           or: busybox --list[-full]
           or: busybox --install [-s] [DIR]
           or: function [arguments]...

                BusyBox is a multi-call binary that combines many common Unix
                utilities into a single executable.  Most people will create a
                link to busybox for each function they wish to use and BusyBox
                will act like whatever it was invoked as.

        Currently defined functions:
                [, [[, addgroup, adduser, ar, arping, ash, awk, basename, blkid,
                bunzip2, bzcat, cat, catv, chattr, chgrp, chmod, chown, chroot, chrt,
                chvt, cksum, clear, cmp, cp, cpio, crond, crontab, cut, date, dc, dd,
                deallocvt, delgroup, deluser, devmem, df, diff, dirname, dmesg, dnsd,
                dnsdomainname, dos2unix, du, dumpkmap, echo, egrep, eject, env,
                ether-wake, expr, false, fdflush, fdformat, fgrep, find, fold, free,
                freeramdisk, fsck, fstrim, fuser, getopt, getty, grep, gunzip, gzip,
                halt, hdparm, head, hexdump, hostid, hostname, hwclock, id, ifconfig,
                ifdown, ifup, inetd, init, insmod, install, ip, ipaddr, ipcrm, ipcs,

# tftp
BusyBox v1.22.1 (2014-05-27 14:35:53 EDT) multi-call binary.

Usage: tftp [OPTIONS] HOST [PORT]

Transfer a file from/to tftp server

        -l FILE Local FILE
        -r FILE Remote FILE
        -g      Get file
        -p      Put file
        -b SIZE Transfer blocks of SIZE octets
